**Subject:** Irradiation of foods

Our issue is about the lack of choice. Unless you can either grow your own, or source the food locally, you will have no other choice.

The "inconsequential" changes in Vitamin B levels and the "almost imperceptible" chemical changes and removal of all microbes, some of which may be beneficial, is a risk that is proposed to be taken in a very paternalistic approach to what is essentially the food that becomes us and may affect our health.

What we ingest for our bodies is resynthesized into our own muscles, brains and internal organs.

For this reason we are against the introduction of full scale irradiation.

We believe we must retain our own choice.
